

Questions and Responses

Q: How soon after suspecting pregnancy can I take the test?

R: You can test your urine as early as the first day you miss your period. You can perform the test at any time of the day; however, the first morning urine contains the highest concentration of pregnancy hormone.

Q: Do I have to test with the first morning urine?

R: Although you can test any time of day, your first morning urine is usually the most concentrated and contains the most hCG.

Q: How accurate is the test?

R: A clinical evaluation compared the Make A Baby® to another commercially available urine membrane hCG test. The consumer clinical trial included 216 urine specimens, and both assays identified 76 positive and 140 negative results. The results demonstrated >99% overall accuracy of the Make A Baby®.

Q: Which factors may affect the test result?

R: Drugs containing hCG (such as Pregnyl, Profasi, Pergonal, APL) can give false positive results. Alcohol, oral contraceptives, painkillers, antibiotics or hormone therapies that do not contain hCG should not affect the test result.

Q: What should I do if the result shows that I am pregnant?

R: It means your urine contains hCG and you are probably pregnant. See your doctor to confirm your pregnancy and discuss necessary steps.

Q: Does the result mean anything other than normal pregnancy if it shows that I am pregnant?

R: You should see your healthcare provider to confirm you are pregnant. Your healthcare provider can advise you on what steps you should take next.

Q: How do I know the test was run properly?

R: The appearance of a red line in the control window (C) indicates you followed the test procedure correctly and the proper amount of urine was absorbed.

Q: What should I do if the result shows that I am not pregnant?

R: It means that no hCG has been detected in your urine and probably you are not pregnant. If you do not start your period within a week of its due date, repeat the test with a new test strip. If you receive the same result after repeating the test and you still do not get your period, you should see your doctor.
